1.
When the following code is executed, how many times is `timer_handler` called?

```
import simplegui

def timer_handler():
    ...

timer = simplegui.create_timer(10, timer_handler)
timer.start()
```

The body of `timer_handler` isn't given, as it is irrelevant for this question. You may want to finish the code and run it before submitting your answer.

- ☐ 0 — The code hasn't been written correctly.
 - ☐ 1
 - ☐ 10
 - ☐ Unlimited — It is called repeatedly until you stop the program.

2.

You want a timer to create exactly 1000 events. Which of the following solutions are possible?

☐

Have a global counter for the number of timer calls.

Outside the timer handler, increment the counter. Outside the timer handler, check the count and possibly stop the timer.

☐

Have a global counter for the number of timer calls.

In the timer handler, increment the counter. In the timer handler, check the count and possibly stop the timer.

☐

Specify the number of timer events when creating the timer.

☐

In the timer handler, have a local counter for the number of timer calls.

In the timer handler, increment the counter. In the timer handler, check the count and possibly stop the timer.

3.

How do you change the frequency of a running timer, either increasing or decreasing the frequency? E.g., in the code below, we want code at the question marks that changes the timer.

```
...
timer = simplegui.create_timer(1000, timer_handler)
timer.start()
...
???
```

☐

Just run `create_timer`. It will change the timer.

```
timer = simplegui.create_timer(300, timer_handler)
```

☐

Create and start the timer again.

```
timer = simplegui.create_timer(300, timer_handler)
timer.start()
```

☐ Just use `set_timer_interval`.

```
timer.set_timer_interval(300)
```

☐ You can't. But, you can stop this timer, and start a new one with a different frequency and same handler.

```
timer.stop()
timer = simplegui.create_timer(300, timer_handler)
timer.start()
```

4.
How many timers can you have running at once?

- ☐ 0
- ☐ 1
- ☐ Unlimited

5.
The function `time.time()` is used in Python to keep track of time. What unit of time is associated with the value returned by `time.time()`? Hint: Look in the documentation.

- ☐ Milli-second
- ☐ Second
-

☐ Minute

☐ Hour

6.

In Python, the `time` module can be used to determine the current time. This module includes the method `time` which returns the current system time in seconds since a date referred as the Epoch. The Epoch is fixed common date shared by all Python installations. Using the date of the Epoch and the current system time, an application such as a clock or calendar can compute the current time/date using basic arithmetic.

Write a CodeSkulptor program that experiments with the method `time.time()` and determines what date and time corresponds to the Epoch. Enter the year of the Epoch as a four digit number. (Remember to `import time`.)

7.

The Python code below uses a timer to execute the function `update()` 10 times, computing a good approximation to a common mathematical function. Examine the code, and run it while varying the input value `n`.

What is the common name for what this computes?

```
# Mystery computation in Python
# Takes input n and computes output named result

import simplegui

# global state

result = 1
iteration = 0
```

```

max_iterations = 10

# helper functions

def init(start):
    """Initializes n."""
    global n
    n = start
    print "Input is", n

def get_next(current):
    """??? Part of mystery computation."""
    return 0.5 * (current + n / current)

# timer callback

def update():
    """??? Part of mystery computation."""
    global iteration, result
    iteration += 1
    # Stop iterating after max_iterations
    if iteration >= max_iterations:
        timer.stop()
        print "Output is", result
    else:
        result = get_next(result)

# register event handlers

timer = simplegui.create_timer(1, update)

# start program

init(13)
timer.start()

```

- ☐ Multiplicative inverse: $1/n$
- ☐ Cosine of n
- ☐ Multiplication by 2: $2n$
- ☐ Exponentiation: 2^n
- ☐ Logarithm base 2
- ☐ Square: n^2
- ☐ Square root of n

8.

Given any initial natural number, consider the sequence of numbers generated by repeatedly following the rule:

- divide by two if the number is even or
- multiply by 3 and add 1 if the number is odd.

The Collatz conjecture states that this sequence always terminates at 1. For example, the sequence generated by 23 is:

23, 70, 35, 106, 53, 160, 80, 40, 20, 10, 5, 16, 8, 4, 2, 1

Write a Python program that takes a global variable n and uses a timer callback to repeatedly apply the rule above to n . Use the code from the previous question as a template. I suggest that your code prints out the sequence of numbers generated by this rule. Run this program for $n = 217$. What is the largest number in the sequence generated by this starting value?

To test your code, starting at $n = 23$ generates a sequence with a maximum value of 160.

9.

you click the "Run" button and then executing this Javascript in your web browser. Open this **example** and run the provided code. If the SimpleGUI frame is spawned as a separate window, you should see an animation of an explosion in the canvas for this frame. If the SimpleGUI frame is spawned as a separate tab on top of the existing window containing the code (as happens in some browser configurations), the animation will "freeze" and a single static image is displayed. (If the SimpleGUI frame spawns as a separate window, you can also cause the animation to freeze by opening a new tab on top of the code window.)

As explained in the FAQ (check the Resources tab on the left), what is the explanation for this behavior?

- ☐ Modern browser don't support running Javascript in multiple windows simultaneously. This situation causes the animation to freeze.
- ☐ Javascript and Python are incompatible languages. As a result, the Python in one tab can't run at the same time as the Javascript in the SimpleGUI frame.
- ☐ To save resources, modern browsers only execute the Javascript associated with the topmost tab of a window. The animation freezes since the code tab and its associated Javascript is no longer the topmost tab.
