

The videos that go over the spark machine learning library will show the basic commands for executing models. The commands and data are in the scripts in the readings that precede the assignment. If you prefer, when viewing the videos you might want to have the scripts handy, so that you can cut and paste, or type the commands into a spark session.

The commands themselves and accompanying methods do not have all that much to them. As I mention in the MLLIB introduction, you will sometimes need to have snippets of code to prepare data, depending on your needs. In these lectures, I keep the examples simple to avoid getting sidetracked into programming. Moreover, running and using the MLLIB commands and results follow the same principles as using Knime or any other machine learning package.
